

## Video Inspection Train VST 05

S & C inspection/patrolling is time-consuming work. The Video Inspection Train VST 05 makes this a thing of the past, by recording details of track and switches with cameras. These images are recorded at a speed of 40 kilometres per hour. This means measurement can take place, without disturbance to railway traffic.

### Analysis

By using intelligent software, the detailed images are sorted and analysed. The maintenance engineer can evaluate the data. The engineer can do this in detail, because an object is recorded from several sides.

### Advantages

- Data is recorded objectively
- Faster inspection time
- Safety of inspection teams
- Better availability track
- Data history
